

## GIT COMMANDS

#Git configuration commands

`git config --global user.name "Your Name"`

`git config --global user.email "your-email@example.com"`

# `mkdir` – used to create a folder or directory

#`cd`-this command is used to change directory

#`git init` – to initialize a repository

# `rm -rf` –to remove or delete a directory

#`touch` –to create a new file

#`nano` –open editor to write in your file

#`git add .` - This stages all the files in the current directory so Git can track them and prepare them for the next commit

#`git commit -m` –commits all staged files to your repo

# `git remote add origin <repo url>` -this tells this is your url of remote repo where u want to push changes,origin is nickname for repo

# `git branch -M main` –rename your current branch to main

# `git push -u origin main`- push all committed changes to your repo
